

RESEARCH FINDS SUPPORT FOR ACCEPTANCE OF VASALGEL

Posted on November 3, 2016

Almost half of men participating in a survey said they would use Vasalgel if it were available. In the study recently [published in Cogent Medicine](#), 146 men in New York with a median age of 24 years were interviewed about their attitudes toward Vasalgel. Aisha King and her colleagues reported that the men were very supportive of Vasalgel's development and 78% thought it was an important invention. These results fit well with other published information on attitudes toward male contraception – summarized on our [Media page](#). The authors also found that previous knowledge of Vasalgel was related to acceptability. So help us spread the word about Vasalgel and the need for male contraceptive options!
